About The Project

EDM Data Base is a lightweight, zero-dependency (frontend-wise) secret file server and vault. It allows you to host your files locally (e.g., on an Android device via Termux, a Raspberry Pi, or any PC) and access them securely through a sleek, customizable Web UI.

All settings, accounts, and server operations are managed through an integrated **CLI Admin Console** right in your terminal.

✨ Features

- **Completely Offline Frontend:** No external CDNs, Google Fonts, or external assets. Everything is bundled.
- **Integrated CLI Console:** Start the server, manage accounts, and monitor stats directly from a beautifully crafted terminal UI.
- **Adaptive Web UI:** Brutalist/Hacker design, themes (Light, Dark, Matrix), customizable shapes, colors, and haptics.
- **Media Support:** Built-in viewer for images, video player, and a text/code editor directly in the browser.
- **Hide/Unhide Vault:** Instantly prepend a dot (.) to your vault folder to hide it from native file managers, controlled via the UI or CLI.
- **Mobile First:** Perfect for running on Termux (Android) and accessing via your phone's browser.

Getting Started (Installation)

Prerequisites

- **Python 3.8+** installed on your system.
- (Optional) **Termux** if you are running this on Android.

1. Clone the repository

Open your terminal and run the following commands:

```
git clone  
[https://github.com/YOUR_USERNAME/edm-database.git] (https://github.com  
/YOUR_USERNAME/edm-database.git)  
cd edm-database
```

2. Install dependencies

Install the required Python packages (only Flask is required):

```
pip install -r requirements.txt
```

(If you don't have a requirements.txt, simply run: `pip install flask`)

3. Run the Server / Admin Console

Start the integrated management console:

```
python server.py
```

From the terminal menu, you can:

1. Create a secure vault path.
2. Setup your login ID and KEY.
3. Press [1] to boot the Flask server.
4. Open the provided Local IP in your browser (e.g., `http://192.168.1.X:5000`).

Usage

- **Upload:** Drag & drop or use the + FILE / UPLOAD buttons.
- **Context Menu:** Tap the `:` icon or long-press any folder card to Rename, Tag, or Delete files.
- **Settings:** Access the settings panel to change themes (Dark/Light/Hacker), toggle Autosave, or adjust border radius.

Contributing

Contributions, issues, and feature requests are welcome! Feel free to check the [issues page](#).
